

TIGER WASH BASIN

The Tiger Wash basin is a small alluvial basin in west-central Arizona (Figure 15). The alluvial deposits are composed of clay, silt, sand, and gravel that probably are less than 1,000 feet thick (Hedley, 1990).

In 1989, depths to water measured in three wells were 28, 58, and 221 feet below land surface. Little water level change has occurred in the basin since 1980 (Hedley, 1990).

Groundwater quality appears to be suitable for most uses with total dissolved solids and fluoride concentrations below the recommended maximum contaminant levels (Hedley, 1990).
